

PICTORIAL EXPRESSION UNDER MUSICAL INDUCTION IN A RETIREMENT HOME

- M. Ch. R. 76 years old -

Comments by paramedical staff:

“ Listening to music started off by exacerbating the general state of Mr. Ch. R : prostration, depressive tendencies, concentration and communication difficulties, the need for help to begin activity. Then, he pointed out the colours that he liked, red, green and yellow. Even if it was difficult for him to give precise verbal responses, he expressed himself using the colours, and became much calmer over several listening sessions “.
